Spatiotemporal modelling of selected enzymes and metabolic pathways (SysCompart WP9)

Project: BMBF SysCompart
Work package conducted by: Dr. biol. hum. Uwe Jandt
Supervisor: Prof. Dr. An-Ping Zeng
Financed by: Bundesministerium für Bildung und Forschung (BMBF)

Description:
The work package 9 within the BMBF funded joint research project SysCompart focuses on the quantitative evaluation of the compartmentalization of metabolic pathways. The focus is set on the spatial separation between cytosolic and mitochondrial sub-networks of the central metabolism.

For this purpose, the spatial distribution of mitochondria within the cell and of key enzyme complexes within the mitochondrial matrix is determined using confocal (Fig 1, 2) and STED microscopy (WP 5). The obtained geometries are combined with a previously developed model of the mitochondrial pyruvate dehydrogenase complex that has been extended with respect to regulation by reversible phosphorylation and exogenous co-factors (Fig. 1, Zeng et al., 2002). The combined spatiotemporally resolved model is implemented in VirtualCell (Moraru et al., 2008; National Resource for Cell Analysis and Modeling (NRCAM) - University of Connecticut Health Center).
