

UNIVERSITY LIBRARY

Open access to technical information

OPEN AND HYBRID

The university library of Hamburg University of Technology, **tub.**, supports research, teaching and learning at the TUHH with the services it offers and its stock of digital and printed media.

Centrally located on campus, **tub.** is easily accessible for all students, who value the service highly. Particularly during the examination period, the more than 330 workstations and group rooms are fully occupied. People not affiliated with the university are also invited to benefit from **tub.**

There are 475,000 printed books in **tub.**, more than 21,000 of which are frequently used textbooks. Modern self-service technology even makes it possible to borrow books from textbook collections and reading rooms at the weekend. **tub.** has, however, been a “hybrid” library for a long time and now spends over 80% of its media budget on digital resources. More than 34,000 online journals and 51,000 online books can be accessed via the campus network. The **tub.find** catalogue can be used to easily search all collections, whether books or articles, printed or online. Licensed subject databases, such as the Perinorm database containing DIN norms, are used for this purpose.

tub. promotes openness, supporting open access to scientific information free of charge and without any technical or legal barriers. This includes the active visualisation of research results via the open access repository **tub.dok**, as well as advice on publishing (including research data) and copyright. Openness also applies to the software used: this is based on open source in the case of **tub.dok** and **tub.find**.

Advice as well as tutorials on topics such as “finding specialist information and not overlooking anything important”, “literature management” and “scientific practices” are offered for both learning and teaching. **tub.** is actively involved in the development of the Hamburg Open Online University (HOOU). In this case, open educational resources (OERs) made available as free-to-use educational materials under an open licence (e.g. creative commons licences) play a major role.

“ Our goal is to tap into new developments in research and teaching at the TUHH as well as in the library and IT world in order to develop suitable services for our user community. In simple terms: we (the library) work well together with the University of Technology. We are similar to a test laboratory in certain respects. We test the feasibility of innovative ideas, with many of these then remaining in regular operation.

Inken Feldsien-Sudhaus, director of tub.
